MZ File MZÁ . GCompris v12.01.full.rar Cracked Version I would like to use RAR 2.6 to compress the data to reduce the size of the file. RAR compressed files have the same size as ZIP files. Is there a way to tell RAR that when it compresses the files, the files should be compressed with RAR's default setting? Does RAR keep a file with the compression settings? If so, where is this file stored? Answer: The detailed knowledge of the engine would be required to answer these questions. You would need to take a look at the source code of Rar for both Windows and for other OS's. You could try to write a small program that opens the Rar archive for testing and dump the settings. Which is the default compression mode for a Rar archive or the default compression mode of your favorite compressor. At the end you could try to compress the original with a program from the same author and the same operating system and compare the results. I hope that this would allow you to answer the question. If you are sure that you need to be able to specify the compression mode in the archive file, then you should be able to define your own compression mode for the archive and save that setting as a "definition" in the archive header. To set a "definition" in a Rar archive you would use the following two arguments in the command line: RAR SFX, TEXT=1, name_of_the_file.SFB, 0x0, true, false, header_where_to_put_your_definition But the "definition" must be stored in binary (yes "true" is binary) data, the encoding is ASCII so make sure that the "definition" is stored with the right encoding. Both of the arguments for the above command are optional, if you don't supply name_of_the_file.SF
